I lead enterprise software implementations and build internal AI-assisted workflows, drawing on 10+ years in customer delivery. I translate business requirements into scoped solutions, guide integrations and validation through sign-off, and help teams take ownership through demos and training. My personal projects extend that experience into agent tools and AI-assisted product development.

Experience

LSL, LLP · Senior Manager

Nov 2025–Present

- Lead Workiva delivery for city and county finance teams, mapping source-ledger data into financial reports and budget books and running user sessions and testing through client sign-off.
- Scope consulting engagements, prepare estimates and statements of work, respond to RFPs, and demonstrate proposed solutions to customers.
- Reset implementation expectations around client ownership, enabling client teams to become comfortable doing the work themselves.
- Develop Python tools that generate Workiva data links, formulas, and validation checks from client ledgers, reused across financial-reporting and budgeting engagements.
- Built an internal AI-assisted cash-flow review workflow covering 11 source workpapers with 69 automated arithmetic checks, flagging discrepancies for human review. Internal workflows are separate from public demos; client changes require human review.

Citrin Cooperman · Manager of Digital Services, Workiva

Dec 2024–Oct 2025

- Managed a five-person Workiva implementation team. Coached consultants, resolved customer escalations, and led testing and training through go-live.
- Led a data-collection and reporting implementation with bidirectional API integration to the customer's system of record, SSO, and an audit trail. Led user acceptance testing through go-live and executive sign-off.

Workiva · Solutions Architect

Oct 2022–Oct 2024

- Led 6–12 concurrent financial-reporting and governance, risk, and compliance implementations from customer onboarding through production use.
- Ran requirements workshops and translated reporting, data, and access needs into implementation designs and test plans, including API, SSO, and ERP integration requirements.
- Worked with Sales and Customer Success on technical evaluations and delivery handoffs. Brought recurring customer issues to Product and Engineering and developed repeatable delivery guidance.

Ambra Health · Solutions Consultant

Sep 2021–Oct 2022

- Implemented medical-imaging and EHR workflows in HIPAA-controlled environments. Worked with customer IT teams to resolve API, SFTP, webhook, and access issues through go-live.

Workiva · SEC Reporting Consultant

Sep 2015–Sep 2021

- Delivered SEC reporting and XBRL services for 20+ public-company customers each quarter. Managed review cycles, resolved reporting issues, and helped customers meet filing deadlines.

Selected AI & Product Work

AI workflows and agent stack

- Design internal workflows around authoritative sources, bounded application access, validation, human review, and recovery. Public repositories and fictional demos are separate from client environments.

AI workflow lesson · Interactive technical education

- Designed the teaching flow and directed implementation through AI coding tools. Visitors check an automated update, reject stale or incorrect proposals, and reconcile a lost response without applying a change twice.
- Fictional inventory data and deterministic browser checks make the failure cases inspectable. Includes a written explanation of the technical decisions.

Passal · Study product

- Own product direction, interface design, and implementation through AI coding tools for a study app that connects lecture sources, study choices, and practice.
- Project stack includes React, Next.js, TypeScript, and SQLite.

Krowbar · Project workspace

- Own product direction, interface design, and implementation through AI coding tools for a workspace that helps people and AI assistants pick up work without rebuilding context.
- The first native integration supports Workiva reporting. The public demo uses fictional data and simulated updates.

Public agent tools

- Accounting Acceptance Lab: built a Python/SQLite lab that tests accounting agents on synthetic reconciliation cases, supporting evidence, approval, and failed-write recovery.
- Regulated Reporting MCP: built an MCP server for reporting APIs through OAuth, with caller confirmation and verification according to each tool's contract. Public demo uses mock data.

Further product work

- **Leasekite:** own product direction, interface design, and implementation through AI coding tools for vehicle comparison and lease-request workflows. In development; private preview.
- Lockfield: shaped the consulting practice's positioning, website, and reporting resources around training and client ownership.

Tools

Python, SQL/SQLite, REST APIs, OAuth/SSO, MCP, React, Next.js, TypeScript, HTML/CSS/JavaScript, Docker Compose, and GitHub Actions. Development uses AI coding tools throughout.

Education

Iowa State University · Master of Accounting, 2017 · B.S. Accounting, 2016
